This article [*J. Biomed. Opt.* **27**(12), 125001 (2022) doi: <https://doi.org/10.1117/1.JBO.27.12.125001>] was originally published on 14 December 2022 without references to some relevant prior work using lasers for microdissection of a tissue section.

The following text and references were added to the 2nd paragraph of the Introduction section:

While lasers have been utilized previously for laser microdissection to harvest cells from thin histologic sections or cell cultures,^{10–14} the laser microbiopsy approach described here harvests three-dimensional tissue volumes from thick tissues. In addition, we describe a photothermal cutting mechanism as opposed to plasma mediated ablation used for laser microdissection.^{13,14}
