Proc. of SPIE Vol. 9265 926501-1

The papers included in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. The papers published in these proceedings reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID Number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID Number.

Contents

- v *Authors*

SESSION 1 REMOTE SENSING/MODELING I

- 9265 03 **Satellite data assimilation in global forecast system in India (Invited Paper) [9265-2]**
- 9265 04 **Derivation of regional aerodynamic roughness length by combining optical remote sensing and ground measurements over agricultural land in Heihe River Basin [9265-3]**
- 9265 07 **Assimilating scatterometer observations of tropical cyclones into an Ensemble Kalman Filter system with a robust observation operator based on canonical-correlation analysis [9265-6]**
- 9265 08 **Observing system simulation experiments with multiple methods [9265-7]**
- 9265 09 **Improving accuracy of Eutrophication State Index estimation in Chaohu Lake by moderate resolution remote sensing data driven method [9265-9]**

SESSION 2 REMOTE SENSING/MODELING II

- 9265 0B **Processes and mechanisms of persistent extreme precipitation events in East China (Invited Paper) [9265-26]**

POSTER SESSION

- 9265 0E **Numerical simulation of suspended sediment transport merging with satellite derived data in coastal waters [9265-8]**
- 9265 0F **Regression modeling of finite field and anti-electromagnetic design for the ocean surface wind speed measurements of the FY-3C microwave imager [9265-15]**
- 9265 0G **Spaceborne imaging simulation of ship based on Monte Carlo ray tracing method [9265-16]**
- 9265 0N **Spatial and temporal distribution characteristics of near-surface CO₂ concentration over China based on GOSAT data [9265-23]**

9265 00 **Reliability evaluation of soil moisture and land surface temperature simulated by Global Land Data Assimilation System (GLDAS) using AMSR-E data [9265-24]**

Authors

Numbers in the index correspond to the last two digits of the six-digit citation identifier (CID) article numbering system used in Proceedings of SPIE. The first four digits reflect the volume number. Base 36 numbering is employed for the last two digits and indicates the order of articles within the volume. Numbers start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B...0Z, followed by 10-1Z, 20-2Z, etc.

b Key Laboratory of Digital Earth, Institute of Remote Sensing and Digital Earth, Chinese Academy

of Sciences, No. 9 Dengzhuang South Road, Haidian District, Beijing, 100094, P.R.China, 86-10-82178138

Summary

Owing to the inevitable drawbacks of prevailing eddy identification methods, we proposed a new Universal Kriging Algorithm with a simplified set of criteria and higher speed. Signal fields were computed on the Sea Level Anomaly data. An optimization is acquired after removing trends and noises in the signal fields by interpolation. Amplitudes and vari-values are correlative, making it possible to extract locations and extents of vortices by few characteristic isolines. The success/excess of detection rate is around 90% /less than 20% respectively. It shows a high accuracy and flexibility in detecting mesoscale eddies comparing to the prevailing algorithms.
